This experience is a guided tour of the world where you will get to design your own Invisible Man just like Mr. Griffin. Know Your Risk If You Have an External Shunt If you have an external cerebrospinal fluid (CSF) shunt system, your shunt may become infected. Shunts most often become infected because they are not functioning properly and a patient fails to promptly use the CSF valves. Other possible reasons for shunt infection include trauma to the head or neck during shunting, improper shunt placement, infection in the head or neck, and improper care of a patient who has an external shunt. External CSF shunt systems help control CSF pressure. The shunt directs fluid from the patient's cranial ventricles (fluid-filled spaces within the brain) into a reservoir or to the patient's skin, where it can be absorbed. The CSF circulates in a closed system and is then filtered out of the system and replaced by a substance called colloid.
